
Dark bar: share of the 232 untestable cardiovascular targets that would require this measurement. Pale bar: share of all cardiovascular targets that measurement can actually test today. Nearly half of untestable targets need heart or vessel tissue, the measurement that can test only 7.1% of all cardiovascular targets. Circulating-protein data would cover a further 6.5%, but no resource is accessible: UK Biobank-PPP requires credentials and deCODE could not be verified.
Reproduce: python src/cv_atlas.py ; python src/make_figures.py
